

Fork Positioner for Forklift

Forklift Fork Positioner - The fork positioner is actually a hydraulic apparatus which could allow the individual driving to operate the forklift without leaving the seat. They are made out of top quality materials and are intended to be able to endure the most demanding procedures and work environments. Side shifting units have the added ability to laterally position the arms or the entire load so as to facilitate more precise carrying and placement in a faster and more efficient way.

The blade pocket is somewhat unique and can enable the one operating it to be able to securely swing the blades into position without any fear of damaging the positioning cylinders. This could allow the driver the choice to execute independent or simultaneous fork movement, depending on the requirements of the job. For most lift trucks with non-OEM carriages, complete carriages are needed. Standard OEM carriages can be transformed into fork positioners on existing units.
